

Improving Your Business through Process Automation

iPAS is made up of a complete set of application tools used to define, develop, implement and deploy browser-based automated business applications. These tools can be deployed in many combinations and as part of phased implementations to ensure incremental success and continual business value to meet any budgetary requirement. The solutions are scalable from 5 to 50,000 users.

iPAS is built on a Services Oriented Architecture to maximize the benefits of our technology for our clients. Utilizing an SOA approach provides rapid deployment, easy integration, component reuse and long-term cost management.

Professional Services

Effective Business Process Management (BPM) is dependent on the quality of business evaluation, processes optimization, business process improvement, documentation and best practices that an experienced team provides. These services are critical to deploying a successful solution, ensuring its adoption and realizing the full benefit and potential an automated solution can provide your organization. By following disciplined and proven methodologies, iDatix will help you to discover how iPAS can transform your organization, delivering innovative solutions with unparalleled results.

Simplifying the Workplace

Simplifying the Workplace

iDatix Process Automation Suite (iPAS) is the complete platform to help you drive your business and optimize the efficiency of your workforce. With a document and worker centric approach, iPAS provides a truly seamless and uniquely organic connection between Document Capture, Enterprise Document Management, Workflow Automation and Business Process Management.

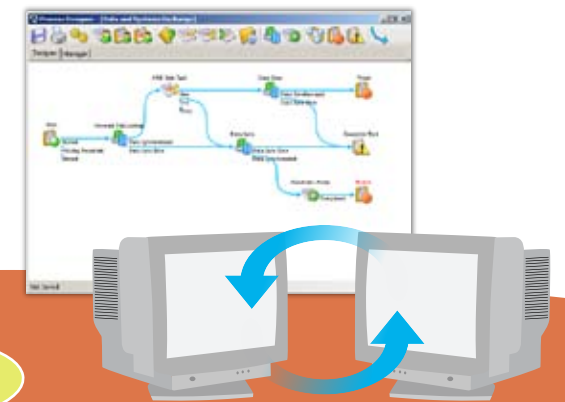

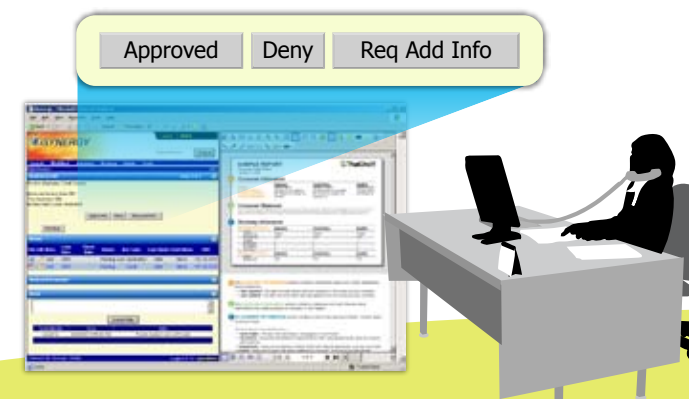

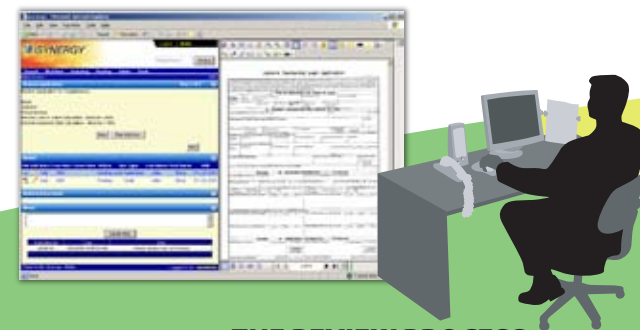

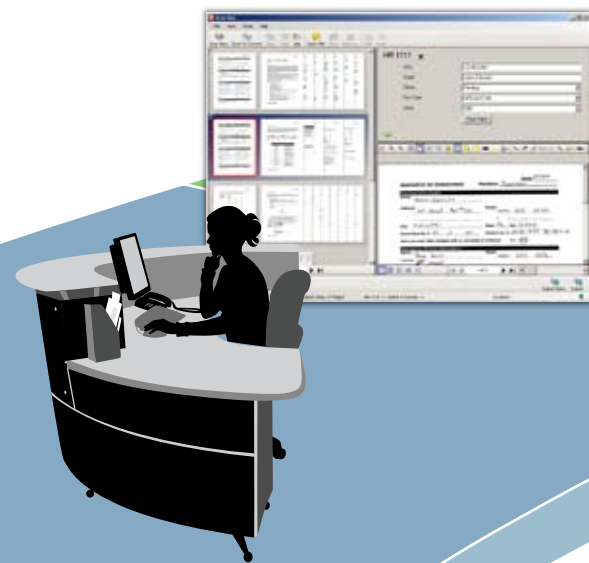

By connecting disparate information systems and leveraging the power of document and content management, iPAS is a seamless information and process portal that provides your organization with the information needed to be more productive, more competitive and more profitable, while providing real-time process monitoring, task management and resource allocation.

Without the need to write any code or consume IT resources, iPAS converts your vision and goals into effective browser-based applications that are rapidly deployed. iPAS provides the tools to easily model, manage, monitor and optimize your business processes removing the dependence on IT by putting the power in the hands of the experienced owner of the day-to-day operations.

PROCESS DESIGN & MODELING

Worker and Document Centric: iDatix utilizes a unique Worker and Document Centric approach to define business processes and significantly reduces the complexity of the design and the management of resources. By using a "Follow the Document" discovery process, you can more accurately develop business processes that will optimize your organization and increase your ability to deliver.

The Model is the Application: With iPAS, there is no lag time between modeling and deploying a working application. With one click, your business process model is implemented throughout your organization.

THE CAPTURE PROCESS

All Data Formats: Information within the organization exists in many forms: paper, files, emails, PDFs, Word, Excel, photos and countless other formats. Using character and barcode recognition, data lookups, file parsing, and meta-data extraction, iPAS Capture can easily, seamlessly and rapidly file your mission-critical documents and information into a centralized repository, providing instant accessibility across your enterprise.

Web-based Capture: iPAS Capture works across the Internet supporting easy capture of all content types from remote sites and outsourced operations.

THE REVIEW PROCESS

Process and Workflow Repeatability: Information and applications are presented in the order needed to complete the activity rapidly with accountability for every action. Complex Review processes become simple instructions with a series of "Next" operations to accelerate the completion of a task. Essentially, a new staff member can be productive and perform billable work on their first day. Process enforcement worries become non-existent as everyone will follow the correct process, every time.

DECISION MAKING & APPROVAL PROCESS

One-click Decision Making: Often decision making processes significantly slow down operations. iPAS simplifies the document approval process down to clicks on a web page and reduces the possibility of error. When a document reaches an approval stage, the resource assigned to the approval task receives a notification prompting review of the document. With iPAS, you are assured that the processes, policies and procedures are followed with complete accountability for every step. Turnaround times improve; delays are eliminated, and nothing will fall through the cracks.

SYSTEMS INTEGRATION

SOA, .NET and Open Standards: Each action within a business process can trigger the need to share information with or between existing business applications and databases. Actions outside of the business process application may need to be started and monitored. iPAS provides a complete set of tools that allows for the exchange of any external data between disparate systems at the time required. It also allows external programs, batch files and web applications to be used as parts of the defined business process. External applications can be triggered and monitored to affect the flow of the defined business process.

Management by Metrics: Business Activity Monitoring (BAM) empowers business managers with accurate process metrics and graphs, iPAS gives you the monitoring, management and reporting tools to control your business processes. "At a Glance" dashboard components let you know the status of any critical business process or task. You can see resource availability, average time of task completion, task volumes, and backlogs. Also, with iPAS, you can set alerts and escalation procedures, making management more efficient and effective.

Resource Allocation: iPAS automates the burden of queue management and allows for the maximum utilization of resources within the organization. With a simple drag and drop, resources and work can be allocated to optimize the process or meet rapidly changing business demands.

MANAGEMENT AT A GLANCE
